

# Difference between the MOON 600i vs 600i v2

Boucherville, Québec, 11/09/2017

Dear Partner,

Many of you have been inquiring about what the differences are between the original 600i Integrated Amplifier (now discontinued) and the newly-introduced 600i v2 (pronounced "version 2" or simply "v2"). There are technical differences, with the goal being to take the sonic performance of the 600i v2 to a new level, beyond the capabilities of the original 600i. Due to the nature of the upgrades, it is not economically feasible to upgrade from one to the other.

## Differences

- Power Supply: the 600i v2 has an upgraded power supply thanks to new, proprietary ultra-high quality main reservoir capacitors;
- Preamplifier Stage: subtle design modifications and the addition of new, high-speed semiconductors in key areas of the gain stages.

## Combined together, the final result of these two upgrades is enhanced sonic performance

- Increased transparency, resulting in a more realistic, you-are-there musical picture;
- Increased tonal accuracy, better definition of instrument timbre, attack and decay;
- Increased size of soundstage in all dimensions;
- Improved tightness and rhythm in bass frequencies;
- Smoother, more organic and live sound without sacrificing accuracy and pin-point imaging.

Please share this with customers!
